SMART INDIA HACKATHON 2026 · SIH26035 · PITCH VIDEO SCRIPT

Taraazu, in five minutes

One presenter on face-cam over a live walk through the portal. A report is built on camera for the profile, test list and engine, then the fully signed report shows the audit trail and outputs. Four pause-and-guess challenges keep the viewer thinking along.

5:00	~597	11	4	EN
running time	spoken words	segments	viewer challenges	face-cam + screen

BEFORE YOU HIT RECORD

1. Record the morning after a nightly reset (02:00 IST), so the demo reports are clean.
2. Browser at 125% zoom and 1920×1080; bookmarks bar hidden; notifications off.
3. Tab 1: sign-in page. Tab 2 (second browser profile): the Director on /reports/TS-DEMO-0001/overview.
4. Do one dry run of segments 02–05 and confirm the “26 apply · 8 excused” count.
5. Face-cam bottom-right at about 20% of the frame. Look into the lens on every challenge card.
6. Replace [Name] and Team [Name] before recording.

Screen is what to click. **Callout** is the overlay or zoom to add in editing. Large text is spoken word for word. Blue tags are actions taken while speaking.

00 Sign-in: the hook — 0:00–0:30

SCREEN
Tab 1 on the sign-in page. Speak first, then click **A. Assistant (MA)** at the end.

CALLOUT
Title card: *Taraazu · SIH26035 · Department of Consumer Affairs*

Every weighing scale sold in India, from your kirana shop to a forty-tonne weighbridge, needs model approval from the Department of Consumer Affairs first. That approval rests on a sixty-two-page test report under OIML R 76. It's full of calculations, and government labs still fill it in by hand, in spreadsheets.

I'm [Name], and this is Taraazu. We don't fill that report. We compute it.

Three officers, three roles, as the Rules lay out: the Assistant records, the Assistant Director reviews, the Director approves. I'll sign in as the Assistant.

01 Dashboard — 0:30–0:45

SCREEN
Hover over the four counters, then the annual-return tiles.

CALLOUT
Box around: Models tested · Fees realised · Median turnaround

Here are the reports in process, completed, and sent back. And these tiles are the annual return that Rule 4(9) already requires: models tested, fees and time taken, all computed, never typed.

02 New report — 0:45–0:55

SCREEN
Sidebar → **New report**. Open **Conformity profile**, pick the Seventh Schedule, fee 25000, create.

CALLOUT
Highlight the dropdown: Seventh Schedule (India) · OIML R 76

Every report starts by choosing its rulebook: India's Seventh Schedule or OIML R 76. The law allows either.

03 Instrument profile — 0:55–1:35

SCREEN
Class **III**, multi-interval, Max **2 / 5 / 15 kg**, e **1 / 2 / 10 g**, electronic, self-indicating. Type `8100kb` in **Checksum** and save.

CALLOUT
Zoom in on the finding under “Worth checking”.

This is the standard's own worked example: a class III scale with partial ranges up to 2, 5 and 15 kilos, where the scale interval grows with the load.

❚❚ PAUSE AND GUESS **Is “8100kb” a valid software checksum?**

I've typed “8100kb” as the software checksum. Pause the video: is that valid? `2-second beat`

REVEAL · ZOOM ON THE RED FINDING

It's a file size, not a checksum. We found values like this on real certificates in the public register. Taraazu catches it the moment it's typed. Fix it to a hex value, save, Next.

04 Tests: the automatic test list — 1:35–1:55

SCREEN
Scroll past the applicable forms and stop on one marked “– –”.

CALLOUT
Big number: **26 apply · 8 excused**, with an arrow to one excuse reason.

Taraazu decides which tests apply. Here twenty-six forms apply and eight are excused, and each one carries the clause that excuses it. No two labs can disagree on what had to be tested.

05 Observations: the engine — 1:55–2:55

SCREEN
Weighing performance form. Type correct readings at **500, 2000, 4000, 4200, 10000 g**. The verdicts turn green.

CALLOUT
Formula strip: **E = I + ½e − ΔL − L · Ec = E − E_0 · pass if |Ec| ≤ mpe**

This is where the spreadsheet used to be. I type what the scale showed, and the error, the permissible limit and the verdict are computed live with the standard's own formula.

❚❚ PAUSE AND GUESS **Same scale: 4,000 g vs 4,200 g. Is the permissible error the same?**

Four thousand grams against four thousand two hundred, on the same scale and in the same partial range. Is the allowed error the same? Pause. `2-second beat`

REVEAL · ZOOM ON THE MPE COLUMN: ±2 G → ±3 G

No. Plus or minus two grams becomes plus or minus three, while nothing changes on the display. That's the row a spreadsheet gets wrong. Type ~12 g over at 5,000 g. It turns red. A bad reading fails immediately, with the limit it broke. And there's no AI in this calculation, on purpose: OIML says AI isn't court-proof for legal metrology yet.

06 The finished report — 2:55–3:15

SCREEN
Switch to **Tab 2** (Director, `TS-DEMO-0001`). Overview, then quickly scroll **Checklist** and **Attachments**.

CALLOUT
Status pill: **PUBLISHED** · three signatures ✓

This report went the whole way: recorded, reviewed, signed by all three officers, locked and published. The 363-item checklist, the model photo and the sealing diagram are all part of it.

07 Audit trail and outputs — 3:15–3:55

SCREEN
Click **Report**. Scroll to "The chain verifies" and the signatures, then up to **Download → PDF**.

CALLOUT
Three labels: PDF, the record · DOCX, watermarked review copy · JSON, for machines

❚❚ PAUSE AND GUESS **Someone edits one reading after the Director signs. Would anyone know?**

If someone changed one reading after the Director signed, would anyone know? Pause.
`2-second beat`

REVEAL · HIGHLIGHT "THE CHAIN VERIFIES"

Yes. Every entry is hash-linked to the one before it, and every signature covers the whole chain. Change one number and the chain stops verifying. A correction is a new entry, and the original stays. Open the PDF. Then the report itself, in the R 76 layout, bilingual in Hindi and English. The PDF is the record, the Word file is a watermarked review copy, and the JSON is for machines. They all come from one computed document, so they can't disagree.

08 Family solver — 3:55–4:20

SCREEN
Sidebar → **Family solver**. Table 8 is preloaded. Ask the question first, then press **Solve**.

CALLOUT
Zoom: **1.2 · 2.1 · 2.4** and the generated coverage clause

❚❚ PAUSE AND GUESS **8 variants of one scale. How many must be physically tested?**

A manufacturer submits eight variants of one design. How many must the lab physically test? Pause. `2-second beat`

REVEAL · PRESS SOLVE

Three. That's exactly the answer in the standard's own table, and it writes the certificate's "shall also cover" clause too.

09 Quick tour — 4:20–4:40

SCREEN
Modules → **Rule pack** (point at the mpe table) → **Statistics**. About 6 s each.

CALLOUT
Caption on Rule pack: *The standard is data, not code*

Modules checks an indicator and a load cell before any testing. The rule pack is the standard as data, so when R 76 is rewritten from two parts into five, we swap this file, not the code. And Statistics files the annual return.

10 Close — 4:40–5:00

SCREEN
Back to the dashboard. Face-cam full screen for the last line (optional).

CALLOUT
End card: *taraazu.vercel.app · SIH26035 · Team [Name]*

Putting applications online halved approval time, from six to nine months down to three or four. Taraazu digitises the half that's still on paper. Every lab gets the same rulebook, a tamper-evident record, and not one hand calculation. Try the challenges yourself at taraazu.vercel.app. Thank you.

YouTube description

```
Taraazu computes the OIML R 76 type-evaluation test report for non-automatic weighing
instruments (NAWI), the report behind every model approval of a weighing scale in India.
Built for Smart India Hackathon 2026, problem statement SIH26035 (Department of Consumer
Affairs, Legal Metrology).
